Mantooth report

Mantooth investigation

I will be working on a computer system that was seized from the residence of Wes Mantooth. A search warrant was completed and after a raid of the residence a laptop was recovered. I will complete a full exam and report any artifacts related to terrorism, planned attacks, or others involved. From what can be seen through FEX, it seems as though the machine also has a Linux partition.

Software Files

From the Windows **SOFTWARE** hive parsed in FEX I found a broad mix of applications and vendors including Apple components (iTunes/Apple Mobile Device Support), Microsoft and Google products, FileZilla, AOL/America Online, ICQ, Kazaa (peer-to-peer), ATI Technologies (graphics), Netscape, Novell, PGP, and Yahoo. This indicates that the system was used for web, messaging, media handling, P2P, and general productivity. The vendor keys provided also tell us about the potential user activity tied to those applications.

Analysis of artifacts recovered through **Magnet AXIOM** revealed a series of search queries executed by the suspect, including **“making meth,” “atm card stealing,”** and **“check washing.”** These queries were identified across the Google Search engine and appeared repeatedly over time. The recurrence of these terms, combined with their specificity, strongly suggests intentional research into illicit activities rather than incidental exposure to unrelated content. Such research indicates Mantooth’s clear interest in methods associated with narcotics production, financial fraud, and ATM card theft, each representing serious criminal conduct. The presence of these searches within the suspect’s digital footprint also provides compelling circumstantial evidence of both **intent and capability**. By actively seeking information on how to manufacture illegal substances and commit financial crimes, the suspect demonstrates a deliberate effort to acquire operational knowledge.

# Documents

## Windows

### readthis.txt

 Mantooth.E01

#### PREVIEW

Bad checks, also known as NSF checks, bounced checks, rubber checks, insufficient checks, bogus checks, etc., can be a big problem for an individual or for any size company. There are both civil and criminal penalties for this unlawful act, although it is much more costly and difficult to prove a criminal case. Always consider your goal: to recover the money or punish the check writer?

Civil Penalties by State.

### My Confession.txt

 Mantooth.E01

#### PREVIEW

This is my confession.

I am the scum of the earth. I rob from the rich... and the poor too!

I taketh away... and keepeth!

I did it all... I am guilty

Oh, by the way, I am deleting this so you will never find it!

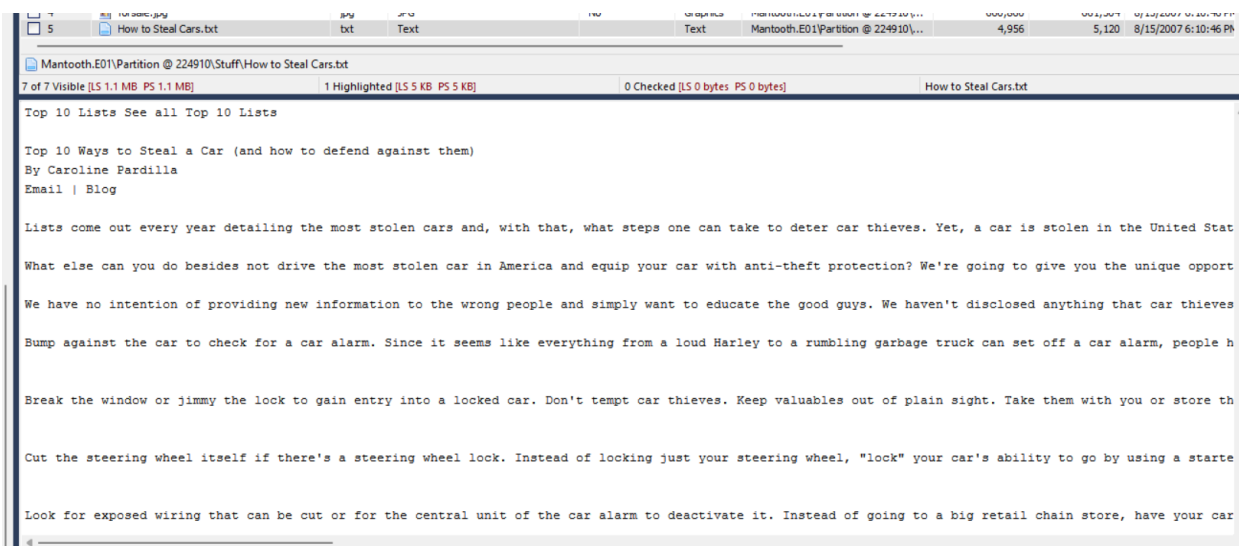

:)

AXIOM Examine shows two notable text files in the Documents area: “readthis.txt,” which discusses bad or bounced checks and the civil and criminal penalties for them, and “My Confession.txt,” which contains a plain-language admission of guilt and a statement about deleting

## Mantooth report

the file so it would not be found. Together, these files point to both knowledge of all offenses and an expressed acknowledgment of wrongdoing, as well as an intent to conceal evidence.

## Linux

Within the Linux partition, I found this file labelled how to steal a car. The presence of this material in Mantooth's digital evidence is significant because it demonstrates familiarity with sophisticated theft techniques. This evidence, therefore, serves as a critical link between Mantooth and the intent to steal cars through the methods described within the article.

## Images

The images shown above include multiple checks suspected to be fraudulent. These checks exhibit characteristics consistent with **check washing** and other forms of financial manipulation, such as altered payee names and amounts. Additionally, the text file titled *readthis.txt* was discusses the legal implications of issuing bad checks, including civil and criminal penalties. The presence of

## Mantooth report

these files suggests that Mantooth had knowledge of the risks associated with fraudulent check activity and may have been researching ways to exploit or avoid detection.

The images shown above are Images that were recovered from the suspect's digital media and depict large quantities of packaged substances and containers commonly associated with drug creation and distribution. These items include sealed bags and equipment indicative of narcotics packaging and handling. Coupled with repeated search queries for "making meth," this visual evidence demonstrates a clear link between the suspect's online research and physical indicators of drug-related activity. The combination of digital and physical evidence suggests not only intent but also capability to manufacture or distribute controlled substances.

Additional images (shown above) found through AXIOM show an ATM interface with a person interacting with the machine, suggesting involvement in ATM-related fraud. This aligns with previously recovered search queries such as "atm card stealing," which indicate the suspect's interest in methods for unauthorized access to financial accounts. The correlation between these searches and the visual evidence provides a strong basis for concluding that the suspect was actively engaged in or preparing for ATM card theft or skimming operations.

## Mantooth report

## PREVIEW

## Confidential Business Proposal

Having consulted with my colleagues and based on the information gathered from the Nigerian Chambers Of Commerce and Industry, I have the privilege to request your assistance to transfer the sum of \$47,500,000.00 (forty seven million, five hundred thousand United States dollars) into your accounts. The above sum resulted from an over-invoiced contract, executed, commissioned and paid for about five years (5) ago by a foreign contractor. This action was however intentional and since then the fund has been in a suspense account at The Central Bank Of Nigeria Apex Bank.

We are now ready to transfer the fund overseas and that is where you come in. It is important to inform you that as civil servants, we are forbidden to operate a foreign account; that is why we require your assistance. The total sum will be shared as follows: 70% for us, 25% for you and 5% for local and international expenses incidental to the transfer.

The transfer is risk free on both sides. I am an accountant with the Nigerian National Petroleum Corporation (NNPC). If you find this proposal acceptable, we shall require the following documents:

- (a) Your banker's name, telephone, account and fax numbers.
- (b) Your private telephone and fax numbers — for confidentiality and easy communication.
- (c) Your letter-headed paper stamped and signed.

Alternatively we will furnish you with the text of what to type into your letter-headed paper along with a

Email artifacts recovered through **Magnet AXIOM** reveal that Wes Mantooth was actively engaged in communications with other individuals regarding operational tasks and coordination. Several emails reference Wes by name, assigning him responsibilities and discussing workload

## Mantooth report

transfers, which indicates his role within a broader network rather than isolated activity. These exchanges suggest collaboration and planning, particularly when viewed alongside other evidence such as instructions for “placing the trap” in an ATM machine to capture user cards. This demonstrates that Mantooth was not only aware of fraudulent schemes but was directly involved in their execution, reinforcing his connection to organized financial crime.

Further analysis of recovered documents strengthens these links. A file labeled “**Confidential Business Proposal**” originating from Lagos, Nigeria, outlines a plan to transfer funds from the Nigerian National Petroleum Corporation (NNPC) abroad, citing restrictions on foreign contracts. Metadata associated with this document lists individuals such as **Rasco Badguy** and **Skimmerman7**, along with organizational details tied to “Elderly People Inc.” and keywords like “Scam” and “Confidentiality.” The presence of this material on the same system as Mantooth’s incriminating files and emails suggests that he was connected to or collaborating with parties involved in international fraud schemes. These associations, combined with ATM fraud instructions and check-washing evidence, establish a clear pattern of coordinated criminal activity involving multiple actors, with Wes Mantooth positioned as a key participant.

## Mantooth report

AXIOM shows that this computer has had several removable devices plugged into it at various times and dates. These devices include flash drives, external hard drives, a camera, and a media player. If the USBs and other devices are found and properly imaged, they could hold more evidence such as files copied to or from the computer, older versions of documents, recoverable deleted items, and photos or media that show activity of Wes Mantooth. They may also contain traces that link back to this system, like shortcuts and thumbnails, with timestamps that help confirm who used the devices and when.

## Conclusion

The digital forensic investigation into the computer system seized from Wes Mantooth's residence has revealed a deeply concerning pattern of behavior, supported by a wide range of digital artifacts. Using tools such as FEX and Magnet AXIOM, the analysis uncovered search queries related to drug manufacturing ("making meth"), financial fraud ("check washing," "atm card stealing"), and vehicle theft ("how to steal a car"). These searches were not isolated or accidental; they appeared repeatedly and were accompanied by documents and images that reinforced the suspect's intent and operational knowledge. Files such as "My Confession.txt" and "readthis.txt" provide direct insight into Mantooth's awareness of the legal consequences of his actions and his attempt to conceal evidence. The presence of fraudulent checks, drug-related paraphernalia, and ATM manipulation imagery further supports the conclusion that Mantooth was actively engaged in criminal activity.

The implications of these findings extend beyond individual wrongdoing. The presence of coordinated email communications and documents referencing international fraud schemes—such as the "Confidential Business Proposal" from Lagos, Nigeria—suggest that Mantooth may have

## Mantooth report

been part of a broader criminal network. These communications indicate collaboration, planning, and role assignment, pointing to organized efforts rather than isolated incidents. This raises serious concerns about the scale of criminal operations and the potential involvement of other individuals. The recovered metadata, usernames, and aliases such as “Rasco Badguy” and “Skimmerman7” further reinforce the notion of a distributed network engaged in financial and cybercrime.

The discovery of connected devices—such as USB drives, external hard drives, and cameras—suggests that additional evidence may exist outside the primary system. These devices could contain backups, deleted files, or media that further implicate Mantooth or link him to other suspects. Their forensic imaging and analysis could be crucial in expanding the scope of this investigation.

Based on the totality of evidence recovered and analyzed, it is the conclusion of this report that Wes Mantooth was knowingly and actively involved in multiple criminal enterprises, including drug manufacturing, financial fraud, and cyber-enabled theft. The digital artifacts recovered provide clear indicators of intent, preparation, and execution. Wes Mantooth should be considered a high-priority suspect in an ongoing criminal conspiracy and held accountable under applicable federal and state statutes.

## Appendix of Terms

**Google Chrome** – A web browser designed by the company Google

**Hard Drive** – A physical piece of hardware that stores your information in a combination of 1's and 0's.

**Hash File** – A digital finger print of each file.

**HIVE** – It is a group of keys and subkeys that have values that support your computer. Only found with Windows operating systems.

**Imaging a drive**- Capturing a bit-by-bit copy of the original contents.

**IP Address**- Internet Protocol that assigned each device with a numerical address that allows it to get on the internet.

**Mail Client** – A program that is used to host your email. Ex. Outlook Express, Outlook.

**NTFS** – New Technology File System, it the file system that is responsible for storing and retrieving files.

**Operating System**- The software that handles the process and memory on your computer. There three base systems. MacOS, Windows, Linux.

**Registry** – Where all the configuration settings are stored.

**Sterile Hard Drive** – A hard drive that has been wiped to all 0's and certified clean.

**URL** – Uniform Resource Locator, it is a web address that can be inputted or clicked on.

**USB** – Universal Serial BUS, a newer type of serial connection that many devices can use.

**Write Blocker**- Can be software or a physical piece of equipment that blocks that restricts the source to a read only status.
