Kreshna Lusha report

Kreshna Lusha investigation

I will be working on a computer system that was seized from the residence of Kreshna Lusha. A search warrant was completed and after a raid of the residence a laptop was recovered. I will complete a full exam and report any artifacts related to terrorism, planned attacks, or others involved.

FEX

Verifying File Hashes

Original Hash from Fex

Acquisition Hash (MD5)	2395107b22c24d17090ebf91da6599db
Acquisition Hash (SHA1)	db6b89b08d50c57ed10f9d7d0eb855bf9c1e759f

Verified Hash from FTK imager

Drive/Image Verify Results

Verify result	Match
[-] Bad Blocks List	
Bad block(s) in image	No bad blocks found in image

To ensure the integrity and authenticity of the acquired digital evidence, hash verification was performed using both FEX (Forensic Explorer) and FTK Imager. The image file, named *KreshnaLusha.E01*, consisted of 41,938,944 sectors. The acquisition hashes generated by FEX were MD5: 2395107b22c24d17090ebf91da6599db and SHA1: db6b89b08d50c57ed10f9d7d0eb855bf9c1e759f. These values were subsequently verified using FTK Imager, which computed identical hashes for both MD5 and SHA1, confirming a match

Kreshna Lusha report

with the stored verification hashes. Additionally, the image was scanned for bad blocks, and no corrupt sectors were found. This successful hash verification confirms that the forensic image is an exact and unaltered copy of the original data, maintaining evidentiary integrity throughout the acquisition process.

The registry hive analysis conducted using Forensic Explorer (FEX) revealed a comprehensive list of software entries under the "Software Files" section. These entries included well-known vendors such as Microsoft, Intel, Mozilla, and VMware, as well as legacy components like Wow6432Node, indicating the presence of 32-bit applications on a 64-bit operating system.

The image above displays the recorded search history from Google Chrome of **Kreshna Lusha**, which highlights a series of queries related to insurgent and extremist activities in Iraq, as well as propaganda material associated with Al-Qaeda. These searches may indicate a potential interest in militant organizations, their operations, and ideological content. While the presence of such search

## Kreshna Lusha report

terms does not, in isolation, confirm direct involvement in extremist activities, it does suggest a possible inclination toward exploring or engaging with materials connected to radical ideologies.

The forensic analysis of the machine revealed a series of media artifacts and documents that collectively suggest potential active involvement in terrorist-related activities. The file metadata indicates it was created, accessed, and modified on **July 28, 2017, at 3:04:14 PM**, with a file

Kreshna Lusha report

size of **2,211 bytes**. The preview image associated with this file shows three individuals seated in a room with various items on the table, which may be indicative of a meeting or planning session.

Further examination of the system uncovered a substantial collection of documents and images referencing Hezbollah, including detailed reports on its organizational structure, training operations, and financial networks. These materials were systematically stored and timestamped across multiple years, suggesting deliberate acquisition and retention. The presence of politically charged imagery, including individuals positioned in front of national symbols, further supports the hypothesis of ideological alignment or operational interest.

The combination of visual evidence, along with consistent metadata and hash verification, supports the conclusion that the user of the system may have engaged in activities beyond passive research. The nature, volume, and organization of the content point toward a sustained and purposeful interaction with materials associated with designated terrorist entities.

The image above presents a list of document files recovered and analyzed through **Magnet AXIOM**. A forensic review of the file system revealed a collection of documents centered around Hezbollah, indicating a focused interest or research activity related to the organization. The most prominent document, titled *"Hezbollah: Portrait of a Terrorist Organization"*, dated **December 12, 2012**, provides a detailed account of Hezbollah's history of terrorist activities in Lebanon and its broader geopolitical impact, including references to the United States and Western Arab states. The document includes images of damaged buildings, suggesting coverage of conflict zones or attack aftermaths.

Additional documents identified include:

- *"Look-who-is-training-Hezbollah-prepares-fo..."* — a text document created on **July 3, 2009**, potentially discussing training operations or affiliations.
- *"E\_158\_12\_1231723028.pdf"* — a PDF document created on **February 6, 2013**, with unspecified content but categorized alongside other Hezbollah-related materials.

Further entries in the file system include:

- *"Hezbollah in Lebanon"*

Kreshna Lusha report

- *"Hezbollah's Financial Network"*
- Other unnamed documents referencing Hezbollah's activities, structure, and operations.

These files span several years and appear to be systematically categorized, suggesting deliberate collection or study.

## Keyword Searches

Search queries and associated media files suggest that the user engaged in activities involving **drug smuggling, bomb construction, and the distribution of falsified identification documents**. These findings are supported by keyword associations and visual content retrieved from the system, which include references to narcotics, explosive devices, and counterfeit credentials. The presence of such materials, combined with previously identified documents related to Hezbollah and other extremist entities, strongly suggests operational involvement in

Kreshna Lusha report

supporting or facilitating terrorist organizations. These artifacts warrant immediate escalation to counterterrorism and law enforcement agencies for further investigation and potential prosecution

The image above illustrates the list of devices that were connected to the system, as extracted through **Magnet AXIOM**. Among the connected hardware are several USB storage devices and an Apple iPhone, as well as virtual and root hub components. Notably, two **SanDisk Ultra USB devices** were registered under the user profile associated with **Krenar Lusha**, indicating potential data transfers or backups to external media.

The presence of multiple removable drives suggests a likelihood of data movement or offloading of files, which could be relevant for determining the extent of information sharing or concealment. Additionally, the Apple iPhone connection highlights the possibility of cross-device communication or synchronization, warranting further forensic examination of mobile backups or linked accounts.

## Conclusion

The forensic investigation into the digital evidence recovered from the system associated with Kreshna Lusha has revealed a deeply concerning pattern of behavior and digital activity. The analysis encompassed registry data, user account information, file system artifacts, keyword searches, media files, and connected devices. Each category of evidence contributed to a broader understanding of the user's potential involvement in activities aligned with terrorist organizations and ideologies.

The system contained a substantial volume of documents referencing Hezbollah, including detailed reports on its structure, training operations, and financial networks. These documents were not only present but were systematically stored and accessed over a span of several years, indicating deliberate and sustained engagement. The presence of politically charged imagery, propaganda content, and references to conflict zones further supports the hypothesis of ideological alignment or operational interest.

Keyword searches recovered from browser history revealed queries related to insurgent activities in Iraq, Al-Qaeda propaganda, bomb-making techniques, drug smuggling, and the use of falsified identification documents. These searches, when considered alongside the document and media evidence, suggest more than passive curiosity—they point toward active research and potential facilitation of extremist operations.

The media files recovered include photographs and videos of individuals in formal or symbolic settings, some of which appear to depict meetings or gatherings. These images, combined with metadata showing consistent access and modification, may indicate planning sessions or ideological reinforcement. The presence of multiple connected devices, including USB drives

Kreshna Lusha report

and mobile phones, suggests possible data exfiltration, cross-device coordination, or external communication.

All digital artifacts were verified through hash matching using both FEX and FTK Imager, confirming the integrity and authenticity of the evidence. No bad blocks were found in the forensic image, ensuring that the data analyzed was complete and unaltered.

Taken together, the nature, volume, and organization of the recovered content strongly suggest that the user of the system may have moved beyond passive research into active support or planning of terrorist activities. The evidence points to a sustained and purposeful interaction with materials associated with designated terrorist entities, and potentially operational involvement in illicit activities such as bomb construction and document forgery.

## Appendix of Terms

**Google Chrome** – A web browser designed by the company Google

**Hard Drive** – A physical piece of hardware that stores your information in a combination of 1's and 0's.

**Hash File** – A digital finger print of each file.

**HIVE** – It is a group of keys and subkeys that have values that support your computer. Only found with Windows operating systems.

**Imaging a drive**- Capturing a bit-by-bit copy of the original contents.

**IP Address**- Internet Protocol that assigned each device with a numerical address that allows it to get on the internet.

**Mail Client** – A program that is used to host your email. Ex. Outlook Express, Outlook.

**NTFS** – New Technology File System, it the file system that is responsible for storing and retrieving files.

**Operating System**- The software that handles the process and memory on your computer. There three base systems. MacOS, Windows, Linux.

**Registry** – Where all the configuration settings are stored.

**Sterile Hard Drive** – A hard drive that has been wiped to all 0's and certified clean.

**URL** – Uniform Resource Locator, it is a web address that can be inputted or clicked on.

**USB** – Universal Serial BUS, a newer type of serial connection that many devices can use.

**Write Blocker**- Can be software or a physical piece of equipment that blocks that restricts the source to a read only status.
