# Introduction

This examination relates to a laptop seized from the residence of Emperor Palpatine pursuant to legal authority granted by the Jedi Order. The objective of the examination was to preserve the evidence through forensic imaging, validate integrity using cryptographic hashes, and then analyze the image for artifacts indicative of illicit activity, including terrorism, planned attacks, and potential associates.

## Verifying Hashes

After acquisition, integrity validation was performed using MD5 and SHA1 hash verification. Hash verification provides assurance that the evidence image analyzed during examination matches the seized data and that no changes occurred during processing, transfer, or analysis.

XMP Metadata: Palpatine.E01\Root\Windows\System32\Microsoft (Bates# 4809)  
-----

No XMP data found.

A representative example of file system metadata was collected from the directory Root Windows System32 Microsoft. This metadata includes standard timestamps and MFT record details, allowing the examiner to describe when the directory entry was created, modified, accessed, and when its NTFS metadata record was last updated.

User level registry information was available for analysis through the Administrator profile hive NTUSER.DAT located under Root Users Administrator. The NTFS metadata associated with this hive indicates a file system timestamp of 23 11 2024 22 09 UTC and an MFT record modified timestamp of 25 11 2024 18 22 UTC.

The primary source for installed software and system configuration on Windows is typically the SOFTWARE hive, normally located under Windows System32 config. During this examination, direct registry sources required for comprehensive system level software enumeration were limited. Where full system hives could not be reliably acquired or parsed, software related findings were derived from corroborating sources such as application directories, program shortcuts, and other on disk indicators of installation and usage. As can be seen in the image above. Internet explorer was installed which leads to emperor Palpatine having access to the internet.

## Images on machine

A review of image content was conducted through axiom. Upon reviewing the images that were parsed one can see that there are depictions consistent with Sith affiliated individuals, weaponized space cruisers, and visual references to cities and planets that could plausibly represent potential targets in a hostile campaign. The collection also contains images of Jedi warriors, which could indicate reconnaissance or targeting of specific individuals or groups. Collectively, these images suggest that there might undoubtedly be an interest in military operations that would lead in helping the Sith invasion and targeting of specific Jedi groups that are rebelling against the Sith forces.

Browser activity from the machine indicates access to content described as “schemas,” which appears consistent with research into structured plans, technical frameworks, or reference models. In the context of this investigation, such material could be relevant to tactics, defenses,

or operational planning intended to counter Jedi capabilities and reduce the effectiveness of Jedi forces.

## Documents on machine

Jedi Order.txt

Palpatine.E01

PREVIEW

There are many enemies I have but none are as revolting as the Jedi.

I hate them all but a few I will make sure to get rid of are:

- Grand Master Yoda
- Mace Windu
- Obi-Wan Kenobi
- Qui-Gon Jin (eliminated)

## Senate Meeting.txt

Palpatine.E01

PREVIEW

Notes for next Senate debate:

- Reach out to Senator Breemu about new mining laws.
- Talk about new Separatist threat.
- Settle trade dispute.

## New Apprentice.txt

Palpatine.E01

### PREVIEW

I am in need of a new apprentice, Maul completed his task but was too weak to see the whole picture.

I have found great promise in the former Jedi; Count Dooku. He has the ability to serve my needs.

I will have him raise an alliance of Separatists against the Republic and have him create a secret droid army to incite civil war across the galaxy!!

A review of all the documents on the system was also done through axiom. The documents contained multiple items consistent with operational planning and targeting themes. Examples of relevant document patterns include written outlines describing campaign objectives and phases, lists of locations and strategic assets, scheduling or coordination notes, and reference style materials describing adversary capabilities and defensive countermeasures. Additional documents appeared consistent with reconnaissance, including compiled summaries of cities and planets, infrastructure descriptions, and entries that resemble target prioritization or risk assessment. In combination, these files are consistent with preparatory activity that could support a hostile operation against the Jedi and their allied forces.

## Conclusion

This reviewed artifacts that can be seen in both FEX and Axiom contain images depicting weaponized space cruisers and Jedi rebel leaders that were marked for execution by the Sith lords. The evidence also contains images of planets and cities that could have been potential targets for invasion as well. Browser activity also indicates access to material described as “schemas,” which may be consistent with researching structured frameworks that could support tactical or defensive planning. The documents that were parsed by Axiom contained material thematically consistent with planning, coordination, reconnaissance, and target research. When considered together, these artifacts support the investigative position that the examined system

was used to conduct research of a hostile nature to aid the Sith lords in an operational effort against the Jedi and their allied forces. Based on the totality of the digital evidence observed, the findings are consistent with preparation and support activities that may satisfy the serious offenses that Emperor Palpatine has been charged with.

## Appendix of Terms

1. Google Chrome – A web browser designed by the company Google
2. Hard Drive – A physical piece of hardware that stores your information in a combination of 1's and 0's.
3. Hash File – A digital fingerprint of each file.
4. HIVE – It is a group of keys and subkeys that have values that support your computer. Only found with Windows operating systems.
5. Imaging a drive- Capturing a bit-by-bit copy of the original contents.
6. IP Address- Internet Protocol that assigned each device with a numerical address that allows it to get on the internet.
7. Mail Client – A program that is used to host your email. Ex. Outlook Express, Outlook.
8. NTFS – New Technology File System, it the file system that is responsible for storing and retrieving files.
9. Operating System- The software that handles the process and memory on your computer. There three base systems. MacOS, Windows, Linux.
10. Registry – Where all the configuration settings are stored.
11. Sterile Hard Drive – A hard drive that has been wiped to all 0's and certified clean.
12. URL – Uniform Resource Locator, it is a web address that can be inputted or clicked on.

13. USB – Universal Serial BUS, a newer type of serial connection that many devices can use.
14. Write Blocker- Can be software or a physical piece of equipment that blocks that restricts the source to a read only status
