

Lab 4.2: Using Active Directory in the Enterprise

Lab 4.2: Part 1 – Creating an Organization Unit and Users in Active Directory

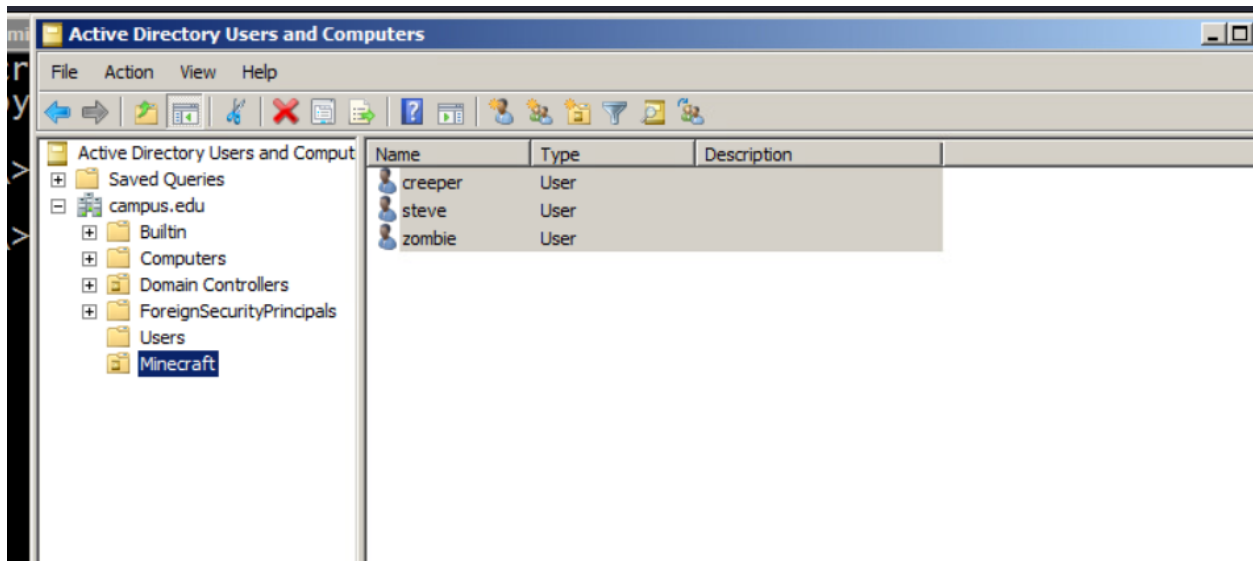

1. Question 6

2. Question 8

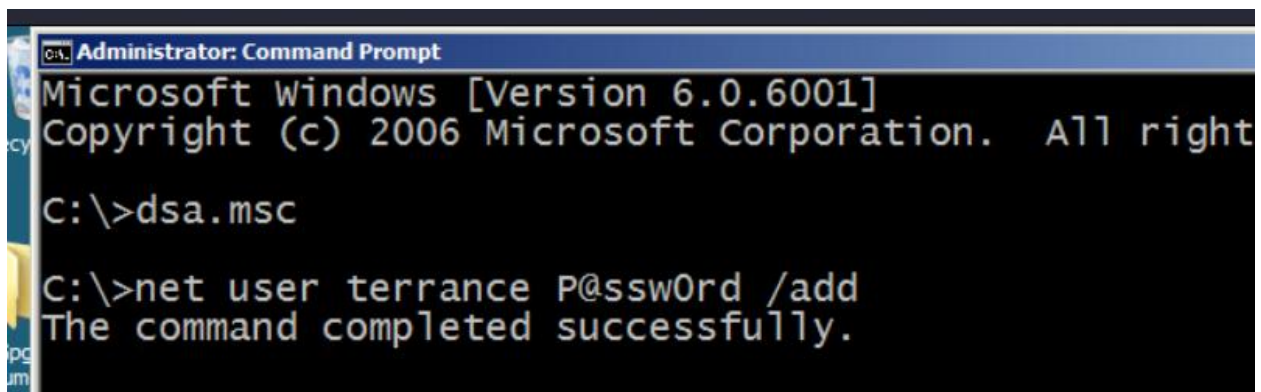

3. Question 19

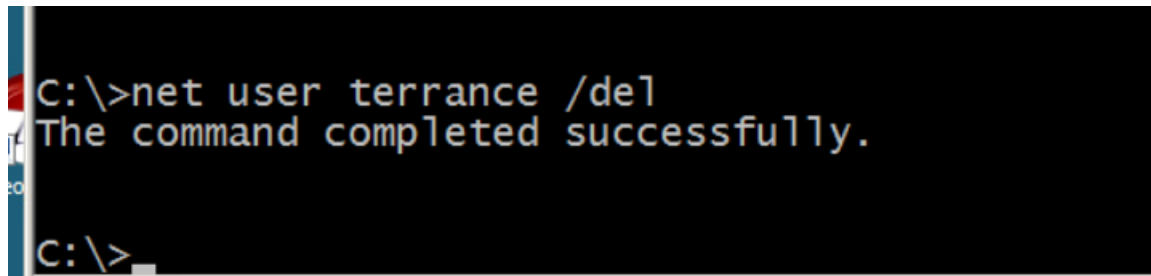

Lab 4.2: Part 2 – Setting a Domain Level Policy in Active Directory

1. Question 1

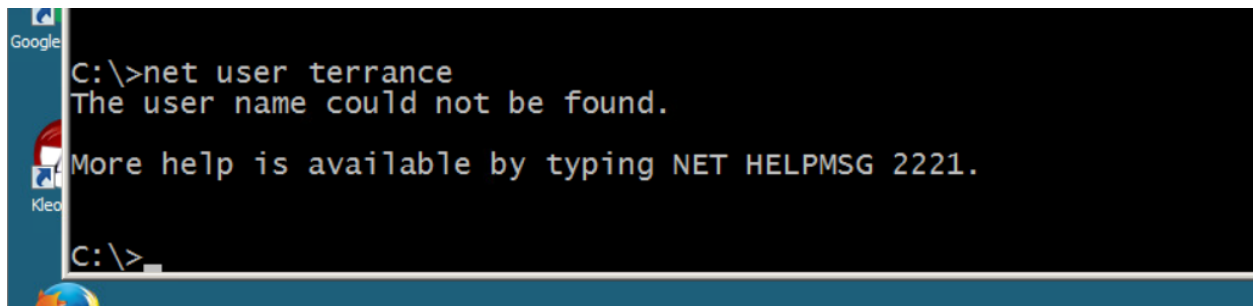

2. Question 8

```
C:\>net user terrance /del
The command completed successfully.

C:\>
```

3. Question 9

```
C:\>net user terrance
The user name could not be found.

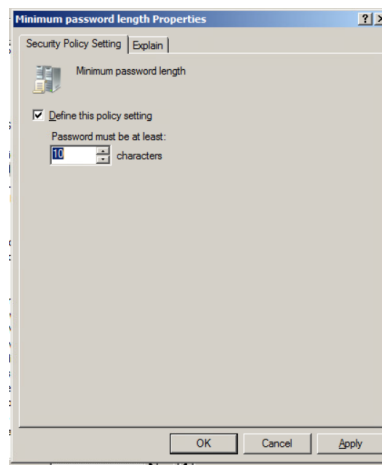

More help is available by typing NET HELPMSG 2221.

C:\>
```

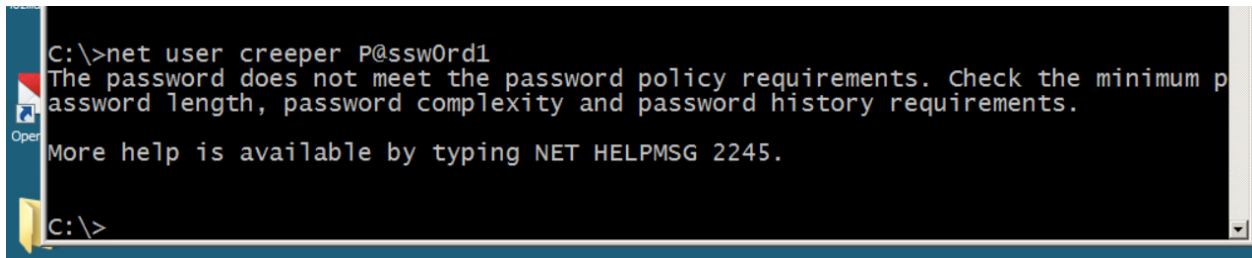

4. Why did the **net user** command fail?

Because the user was deleted

5. Question 14

6. Question 21

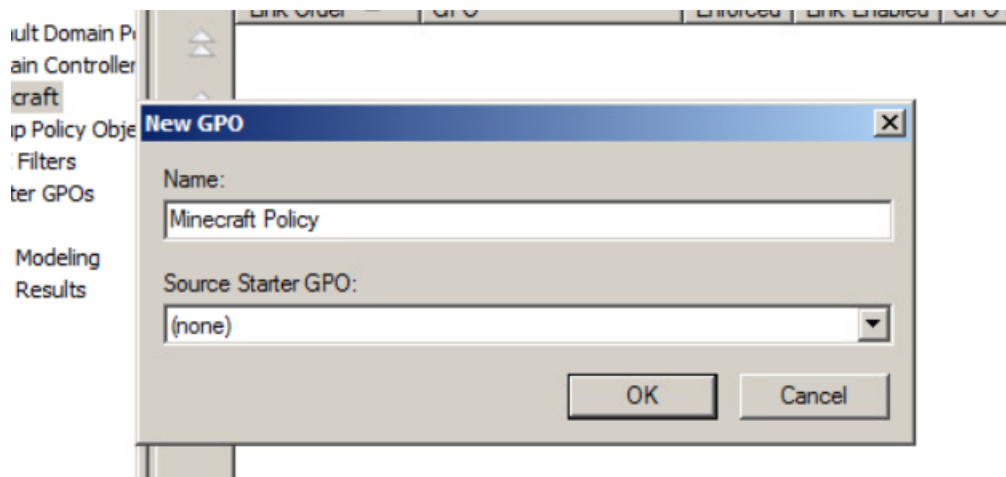

```
C:\>net user creeper P@ssw0rd1
The password does not meet the password policy requirements. Check the minimum p
assword length, password complexity and password history requirements.
More help is available by typing NET HELPMSG 2245.
C:\>
```

7. Why did the changed password fail?

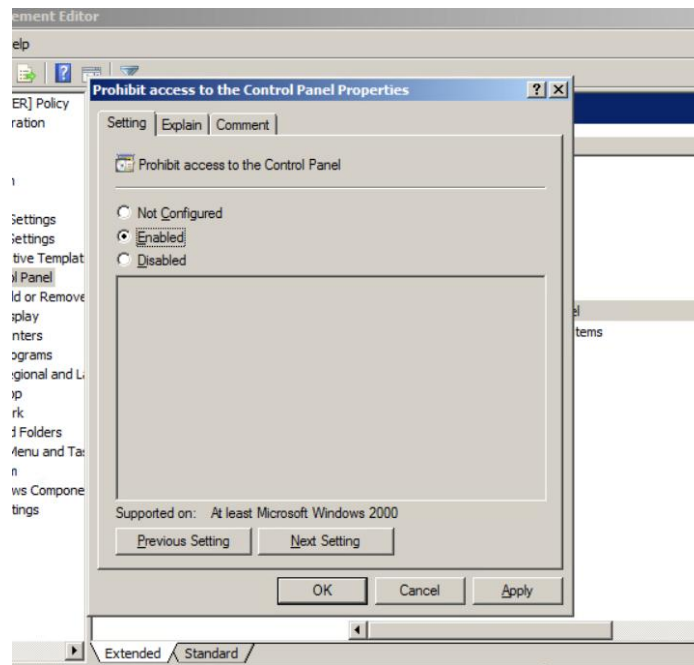

It failed because the password length was wrong

Lab 4.2: Part 3 – Setting an Organizational Level Policy in Active Directory

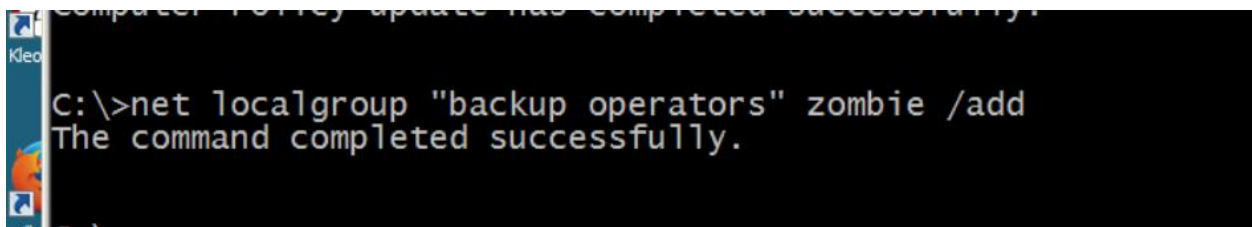

1. Question 3

2. Question 6

3. Question 10

4. What is the command in question 10 doing?

Radds the user "zombie" to the "Backup Operators" group, granting them permission to back up and restore files regardless of file-level permissions.

Lab 4.2: Part 4 – Lessons Learned

In Lab 4.2, I learned how to effectively manage users and organizational units within Active Directory, gaining hands-on experience with group policies and command-line tools that control user permissions and access. I was surprised by how easily elevated privileges can be granted through group membership, which highlighted the importance of careful administrative oversight. Troubleshooting errors like failed password changes and user deletions challenged me to pay close attention to system feedback and command syntax. Overall, the lab took about two hours, and I especially enjoyed the practical use of commands to manage users, though deciphering vague error messages was less enjoyable.
